

MATERNAL AND CHILD HEALTH AND NUTRITION PROGRAM

PROGRESS AND RESULTS

SEPTEMBER 2024

Photo credit: Amy Cotter Fowler, USAID

USAID's maternal and child health and nutrition programs have played a pivotal role in saving millions of lives by driving down mortality rates through improved health care access and delivery.

This success has been made possible through USAID's stewardship, the generosity of the American people and the bipartisan support of Congress.

Continued dedication is imperative as maternal and child survival still remains an urgent global health challenge. By saving lives, curbing the spread of infectious diseases, and promoting economic prosperity, these efforts bolster global stability and demonstrate America's compassionate global leadership.

* This represents the collective lifesaving impact of USAID's investments in preventing child and maternal deaths, including through malaria prevention and treatment, reproductive health and family planning, and our support for Gavi, the Vaccine Alliance, in the 25 USAID priority countries.

**The reported combined reach of USAID maternal and child health and nutrition programs in partner countries excludes contributions from supporting health areas, such as family planning and malaria, and does not factor in impact of the U.S. government's support to Gavi, the Vaccine Alliance.

USAID
FROM THE AMERICAN PEOPLE

USAID's maternal and child survival programs* in the past 10 years have helped our 25 priority countries save

more than
7.4 million
lives

Since 2000, across USAID's 25 priority countries, maternal and child survival has witnessed a remarkable decline:

under-five child mortality ↓ **55%** **maternal mortality** ↓ **42%**

In 2023, USAID maternal and child health and nutrition programs** helped increase access to essential—often lifesaving—care for:

more than
53 million
women and children globally

EVERY YEAR, USAID DELIVERS ESSENTIAL, LIFESAVING CARE FOR CHILDREN AND WOMEN

In 2023, USAID:

-  Helped **12 million women** to give birth in facilities receiving U.S. government support.
-  Resuscitated **238,000 newborns** who were not breathing at birth.
-  Supported **10 million newborns** with postnatal care within two days of birth.
-  Enabled **8.6 million infants** to receive their first dose of the measles vaccine by age one.
-  Reached **28 million children** under age five with nutrition programs.
-  Reached **11 million pregnant women** with nutrition-specific interventions.

OVER THE PAST DECADE, USAID PROGRAMS HAVE TRANSFORMED THE LANDSCAPE FOR MATERNAL AND CHILD HEALTH

Since 2012, USAID Has:

Enabled **67.8 million women** to give birth in a health facility and helped provide care for **55.4 million newborns** immediately after birth.

Giving birth in a health facility with a skilled provider reduces risks of life-threatening complications, improving the chances of a safe delivery for both the mother and the baby.

Provided **139.5 million treatments** to children for diarrhea and pneumonia.

Diarrhea and pneumonia, while largely preventable and treatable with relatively simple interventions, are among the top killers of children under five years old.

Trained **14.2 million health workers** in maternal and child health and nutrition.

When health workers have the expertise to provide timely and skilled care, they can prevent, detect, and manage complications during pregnancy, childbirth, and early childhood. And the provision of high-quality care leads to higher usage rates of maternal and child health services.

Helped **29 million people** gain access to basic drinking water services.

Access to clean and safe drinking water is paramount in preventing waterborne diseases, like diarrhea and cholera, which can be life-threatening for pregnant women and children.
